

Amended Abstract

A reception method, receiver, and radio system are taught. The radio system may include receivers containing a radio part and a baseband part, each receiver using a dedicated narrowband channel. The radio part of each receiver may be configured to receive the narrowband channel used by the receiver from the radio path and to forward the received narrowband channel to the baseband part of the receiver for further processing. The radio part of at least one receiver may be configured to receive at least one other narrow band channel in addition to the channel used by the receiver from the radio path. The radio system may also include a transmitter for forwarding the other narrowband channel from the radio part of another receiver using the other narrowband channel for further processing.
